

FPL's Large Load Rates ensure data centers will pay their own way.

We believe Florida can have responsible data center growth without raising electric bills for our customers.

Florida Power & Light Company is committed to delivering reliable electricity every hour of every day while **keeping customer bills as low as possible.**

That's why FPL created rates that **ensure data centers pay their fair share and FPL customers are protected from the costs to serve new large load projects.**

In other words, existing **FPL customers don't subsidize the energy needs of new data centers.**

We know technology companies are interested in Florida, and we've learned from other states that have already experienced data center growth.

FPL has established large load rates that are the most forward-looking and protective in the nation, ensuring our existing customers are not paying for the energy needs of large load customers, including data centers.

FPL's terms and conditions for large load projects like data centers are specifically designed to protect the general body of customers.

Developers pay: Data center developers must fund 100% of the new power generation required to serve their project.

Location assistance: FPL helps determine the power generation type and location to ensure continued reliability for all customers.

Balanced approach: Large load rates are subject to ongoing review and adjustment to reflect actual cost to serve, ensuring fairness.

Customers win: FPL customers benefit from infrastructure built to serve data centers while being shielded from the costs.
